WHAT IS CLAIMED IS:

1.

arranged in layers comprising, in combination:

spaced apart at least the length of the products to be shipped or stored;

the other two side walls for receiving and supporting the products in layers in the

9	product receiving openings within which the products are received for holding the
10	products out of contact with adjacent products;
11	reinforcing members for the strips extending along the length thereof
12	for preventing sagging thereof; and
13	said other two side walls of the box having dunnage supports adjacent
14	the ends of the reinforcing members for removably receiving and supporting said
15	reinforcing members and associated strips out of contact with superjacent or
16	subjacent layers of products.
1	2. The invention of claim 1 wherein the plastic strips are
2	elongated tubes.
1	3. The invention of claim 1 wherein said dunnage supports
2	comprise upwardly opening pockets for removably receiving the reinforcing
3	members.
1	4. The invention of claim 3 wherein the reinforcing members
2	extend along beneath the plastic strips and means are provided securing the
3	reinforcing members thereto.
	•
1	5. The invention of claim 4 wherein said means comprise bag
2	ties.

A shipping or storage container for elongated products

a box having four side walls with two of the walls being opposed and

dunnage arranged in layers in the box extending lengthwise between

said dunnage comprising elongated resilient plastic strips having

8.

2	upwardly opening V-shaped pockets for removably receiving the triangular tube.
1	Dunnage for supporting multiple layers of products in a box
2	and wherein the weight of superjacent layers of products and dunnage is not borne
3	by surfaces of subjacent layers of products comprising, in combination:
4	elongated dunnage for disposal in the box and of a length to bridge
5	between opposite side walls of the box;
6	said dunnage having an upwardly facing product receiving and
7	supporting portion and a downwardly facing rigidifying portion extending along
8	beneath the product receiving portion; and,
9	dunnage supports for opposite ends of the dunnage for attachment to
10	the side walls of the box and removably receiving the dunnage and supporting the
11	same out of contact with superjacent or subjacent layers of the product.
1	10. The invention of claim 9 wherein said downwardly facing
2	rigidifying portion comprises a reinforcing member of triangular cross-sectional
3	shape disposed in juxtaposition beneath the upwardly facing product receiving and
4	supporting portion and means securing the reinforcing member and product
5	receiving portion together.
1	11. The invention of claim 10 wherein the reinforcing member
2	comprises a plastic panel folded upon itself into a triangular configuration with
3	means holding the folded panel sections together.

The invention of claim 4 wherein said means comprise staples

The invention of claim 1 wherein each reinforcing member

The invention of claim 8 wherein the dunnage supports have

projecting through the reinforcing member and through the plastic strips.

of the triangular shape extending downwardly therefrom.

comprises a triangular tube of flat panels underlying said plastic strips with an apex

- The invention of claim 11 wherein said means comprises bag
 ties wound around the folded plastic panel.
- 13. The invention of claim 11 wherein the bag ties are extended
 2 through the upwardly facing product receiving portion to secure the same to the reinforcing member.
